Singh, who is the third-longest serving military chief, succeeds Pranab Mukherjee who retired from the post last month. Army chief General V K Singh was sworn in as India's 16th President on Wednesday, a day after former Prime Minister Dr Manmohan Singh concluded his six-year term. "Received the oath of office and took the constitutional oath in the presence of Rashtrapati Bhavan," Singh posted on his Twitter account. He is the third-longest serving military chief after former chiefs BJS Bhat and A K Antony. Singh will be the President until January 2017. Under Indian law, he needs to be elected to a second term before taking office as President. "The President is commander-in-chief of the Army, Navy, Air Force and the civil administration. He is also the chief legal adviser to the President and the Army chief," a military expert said. "As the President is also the commander-in-chief, he is the commander of all the armed forces. There are cases where one has to carry out the orders of the President and if that order is not in line with the laws of the land, he has to get permission of the appropriate authority," he added. To be the President, Singh needs to be elected by a majority of the Parliament as he is not eligible for re-election. Earlier this month, Singh was elected the Bharatiya Janata Party's candidate for the Prime Ministerial post. Singh was born in Kurukshetra in 1922, he became the army chief in December 1992 after his father V K Singh was appointed the chief of Army Staff. This invention relates to a method of and an apparatus for manufacturing molded articles by hot compression molding and more particularly to a method of and an apparatus for manufacturing hollow molded articles from a cylindrical preform which is previously heated. A method of manufacturing a hollow molded article by hot compression molding has been known as a method of manufacturing a hollow molded article. As shown in FIG. 2, in this method, a preform 11 is molded into a desired molded article by hot compression molding. That is, in this method, a preform 11 in the form of a cylindrical body, of which sectional shapes of the upper and the lower portions are shaped as shown in FIG. 3, is prepared; the preform 11 is set in a mold 13; and a predetermined pressure is applied to the mold 13 with use of a piston 15. As shown in FIG. 4, the preform 11 is compressed and compressed, and the preform 11 is heated by means of a heater 12 to a predetermined temperature for the molding. Then, the preform 11 is pressed and compressed by a metallic piston 15 to mold it into a molded article. In the above-mentioned method, the molded article is molded only in a case where the preform is produced and has a specified diameter, i.e., it is produced as a fixed size molded article. That is, in the method of manufacturing a hollow molded article, in which it is required that a hollow molded article which has a specified diameter be manufactured, a hollow molded article which has a diameter corresponding to the diameter of the preform is molded. However, in a case where a hollow molded article is to be manufactured by the method of hot compression molding, the aforementioned fixed size is, as a matter of course, not sufficient. Therefore, in many cases, there is used a method of manufacturing a hollow molded article by hot compression molding, in which the molded article is produced in a larger size than the preform, i.e., an oversize process is made. However, in the case of the above-mentioned method of manufacturing a hollow molded article by hot compression molding, in which the oversize process is made, the following inconvenience is brought about. That is, in this method, when the molding is made, an excessive load is applied to the piston and the cylinder, and the metallic piston may be damaged. Further, a large amount of time is required for molding, and a temperature of the pre
