Interleukin-1beta (IL-1beta) is a pleiotropic cytokine that plays a pivotal role in host defense against infection as well as in various inflammatory and autoimmune diseases. Proteolytic activation of IL-1beta is the rate-limiting step to generate its bioactive form, which is composed of the mature, N-terminal form and the inactive C-terminal fragment. Although the N-terminal processing of IL-1beta is well studied, its C-terminal proteolytic maturation remains elusive. We previously showed that proIL-1beta is a substrate for the intracellular cysteine protease caspase-1, which plays a critical role in the maturation and secretion of IL-1beta. Here, we report
