In the early years of CAD software development, architects, engineers and landscape architects (and other designers) typically relied on a suite of different software programs that worked together in order to design and manage projects. These programs included planning applications (for managing schedules and budgets), design applications (for managing drawings and information), and drafting applications (for creating 3D drawings, such as architectural models, floor plans, structural diagrams, and construction documents). Architectural software programs such as SketchUp®, Pro/Engineer®, AutoCAD Crack®, and SketchUp® QuickDraw® were the most widely used products, and others such as W-Works®, Rhinoceros®, and Microstation® supported smaller markets. Most of these programs were proprietary and delivered on physical media,

such as compact discs and floppy disks. Today, CAD applications are largely delivered as subscription-based cloud-based software-as-a-service (SaaS) delivered by third party software-vendors. A CAD application is often sold in a package that includes a server component and multiple software products that are delivered together in a single subscription. During the design and drafting process, the designer uses the CAD application on a client device, such as a desktop or mobile computer or tablet.
