Gearbox can backup your data on a local hard disk to an FTP, a Windows share or an FTP (a remote hard disk). Gearbox will scan the network to look for any updates to files in your directories. While the Scan Network dialog will report any updates or newly created files. We strongly recommend you to create a backup of your hard disk and a recovery plan for each remote machine you use. After all, it's a lot easier to just loose one machine than your entire office! Gearbox requires a lot of space to save all the data that is backed up. If you don't plan to use the network to backup all the data, you may want to consider the internal memory (for instance, the micro SD). If the memory is removed from the computer, the network connection information that is stored on it will be lost, but all data will still be saved. You can also use the memory as a local backup. That is to say, if you keep the SD card with you, the data will be saved in your local system; and as it is not connected to any network, it will not be synced. In order to create an Automatic backup, you will need to give Gearbox Internet access, which will allow the program to download the new updates and the network information. You can also create custom network profiles, and add remote folders that have a synchronization. This will allow Gearbox to download the data, and update and include the new info. Gearbox features an advanced backup tool that has full backup options, automated automatic backup and scheduled backup jobs. You can use it to backup specific files and/or folders in the folders, such as Pictures, Music, Movies, etc. With this tool, you can directly backup a selected folder. If you are not sure that the folder you want to backup contains the data that you want to save, then the options can be a little confusing to you. Gearbox does not require any special settings. Once you install the software, you will immediately be able to use it. As such, the interface is fairly simple, and is organized in three options. On the bottom, you will see the traditional interface. You can access this interface from a menu item in the left corner of the interface, or from an icon on the desktop. In the middle, you will see a list of all of your jobs. That is where you can edit existing jobs, remove jobs, run a report

## System Requirements For Gearbox:

Windows PC - 1GHz Processor 2 GB Ram 10 GB HD Space HD Video Card with DirectX 9.0 Internet Connection If you can remember the above mentioned specifications, you should be fine. For the game itself, it should be similar to any other FPS game of its time. The level of graphics should be considered average for the time. However, because the development of games in the early 2000s took place more on the cutting edge, many of these games lag behind these standards, and this is something we are trying to address.
