It can generate and save passwords for all major Windows applications, ensuring your Windows logins are fast and easy. The program makes it easy to use it, because its functions are divided in different

categories. For instance, password generators and application password generators are in the main screen. The application can be used by using the menu icons found on the top right corner of the application. If you're using password generators, you're given the chance to select the type of generated password: the first time you select the type of password you want to generate, you get the chance to define what are the options for that. This gives you the freedom to decide what the password should include: capitals, numbers, lower case, and so on. When you're ready, hit the

generate button and you'll get a list of generated passwords. You can save the password as an encrypted file or share it directly via Bluetooth or Wi-Fi. If you save the password, the program will encrypt the file so that only you can read it. Password generators can be used to create a default password for all your applications. If you want to use a different password for all your applications, just click on that option. The only annoying feature is the application does not offer any option to save the generated password, so you can't use it later. All the functions are easy to use and the application does

the job adequately, so it can be used by anyone who requires passwords to log on to their Windows PC.
