K-Tree

K-Tree can calculate folder sizes that are recursively and partitioned by type (images, documents, movies, etc). The executable is small (less than 8 KB) and is easily portable. It is distributed as a single file (inz-k*exe.zip). 2. Compress the folder/folder structure you want to compare Click on the folder or folder tree to select the folder/folder structure to be compared. 3. Select the compare interval Click on "Set Interval" to determine the speed at which the calculation is performed. The interval is the number of folder names where the calculations are stopped for the next interval. The slower the interval, the bigger the time-lapse, but it is difficult to compare the size of an entire folder/folder tree because the application takes a lot of time. "Forever" will complete the calculations and calculate the size of every selected folder/folder tree the next time you run the application. 4. Select the sort order Click on "Sort By" to determine the order in which the calculation will be performed. Normally the "Current Size" will be shown last because the file size is being calculated on the fly and smaller files may have been added/deleted in the meantime. The next column will be "Least Used Size" which will show the size of the folder structure after sorting by the size of the least used files. "Descending" will sort the folder structure from largest to smallest size. 5. Run the application Click on "Start" to compare the folder size. You will have to wait until the calculation is finished. 6. Close the application. 7. View the output You can view the output with the "Reset" button. Are there any other musicians who are also opposed to this? Here's why: 1. Business doesn't run without customers. Selling 3D printers takes some time and effort to become successful, and customers buy printers for themselves, not just for the profits. Even if you give them away for free, they're still a purchase the customer makes for themselves. 2. Being a vendor also means that you have to work with your customers. If they don't like 3D printers, then what? The only time they'd see value in buying your printers would be if they wanted to make a particular design, and that design just so happened to be in PLA. 3. Being a vendor
