Table of Contents Who should learn AutoCAD? This course assumes the reader already has a basic understanding of the use of CAD software. The reader should also have at least some experience in using the software applications they will be studying. How AutoCAD works AutoCAD is a multi-function CAD program, allowing a user to make designs, study and analyze geometries, build a model, view that model in three dimensions, and draw, view, and edit the design in two dimensions. Autodesk CAD applications are installed on the user's own computer. The user opens AutoCAD from the application launcher or by clicking the AutoCAD icon. (The AutoCAD icon is present on the desktop in Windows, and on the Applications folder in macOS.) The user can also access AutoCAD through the Autodesk App Store. Upon first opening AutoCAD, the user will be presented with the AutoCAD main screen. After completing the initial setup, the user will be taken to a blank drawing page. The user then opens the Autodesk CAD application launcher, which is represented by the computer's system tray icon. The user can access AutoCAD by clicking the icon and then selecting the desired application (AutoCAD, Inventor, etc.). AutoCAD 2017 is the most recent release of AutoCAD. It is a general-purpose 2D and 3D CAD application with a number of innovative features. It can create and edit AutoCAD drawings, raster images, symbols, and diagrams. It is capable of importing and exporting DXF and DWG CAD files. It can perform a number of analysis functions and can create direct correspondence between points in two different drawings. It can create barcodes, do mathematical calculations, and work with a variety of types of data. AutoCAD drawings are based on blocks and are constructed

Q: Trying to update a attribute in a table after an event with Vuejs I have a table with a 'selected' attribute, which I use to determine which of the rows are active. The rows are generated with v-for and I use a different class to achieve the hover effect. To save this I'm setting the 'selected' attribute. This works fine when the page loads, but I can't figure out how to trigger a re-render after I change the 'selected' attribute. My code is like this: 

```
{{ project.name }} {{ project.company }} {{ project.tech }} {{ project.client }} {{ project.program }} {{ project.start_date }} {{ project.end_date }}
```
