Q: SQL Server - comparing a numeric value to NULL I have a DEFAULT constraint on a column and the DEFAULT value is NULL. Why is it that when I try to insert in this column using INSERT INTO dbo.MyTable (col1,col2,col3) VALUES (value1,NULL,NULL) I get an error message Cannot insert the value NULL into column 'col3', table 'MyTable'; column does not allow nulls. INSERT fails. Is there a way to define a numerical value as the default value for a column in SQL Server? A: The behaviour you describe is correct. The value NULL is not a valid numerical value, and cannot be inserted into any numerical column. What is likely happening is the INSERT statement is failing because the numeric value is out of range (bigger than 32K or smaller than -32K). A: NULL values are not always the same as numbers as in this example: declare @myVal int set @myVal = NULL select @myVal select 0 = '0' select NULL = '0' select (NULL) = NULL select '1' = NULL select NULL = NULL select -123 = ' NULL = NULL select -123 = '

The first stage is a "main amplification stage" for the high-frequency band and the second stage is a "post amplification stage" for the low-frequency band. Therefore, it is possible to realize amplifying operation with a gain ratio of about 107 to 10.sup.8. In the invention according to the second aspect of the present application, the preamplifier is connected to the main amplification stage and the base of the first FET and the base of the second FET are connected to the post amplification stage. Accordingly, it is possible to realize amplifying operation with a gain ratio of about 105 to 10.sup.8. To achieve the first object, the invention according to a third aspect of the present application uses FETs having low gate resistance in the main amplification stage and, in the charge-transfer tube, makes the first FET constituting the amplifier have a gate voltage of approximately +2 V and the second FET constituting the amplifier have a gate voltage of approximately -2 V. The relation between the gain in the conventional band-pass amplifier and the gate voltage applied to the FET is shown in FIG. 23. The gain ratio varies in the range from 10.sup.4 to 10.sup.5, and the gate voltage of the FET has a range of 2 V to -2 V (in the case of monocrystalline silicon). In the invention according to the third aspect of the present application, the first FET and the second FET are employed in the charge-transfer tube. Therefore, the range of the gate voltage of each FET is reduced to 1 to 2 V, and the range of the gain ratio becomes an extreme value of about 10.sup.5. For this reason, the gain ratio can be made higher than the conventional value in the case of the second aspect of the invention e79caf774b
