From KIRITAMA'S PROMOTION VIDEO:

Launched on June 11, Tarnished is 100% FREE to PLAY. The best Tarnished service in free-to-play games.
But what is "free-to-play"? Tarnished is a service that delivers the most of the "service fee" in Japan. (The most beautiful and joyful worlds are the most expensive in free-to-play.) Your transactions pay for the part of the service fee that bears the risk.

Click "I Agree" and Enjoy.A fuel cell is an energy-conversion device that uses energy liberated by the reaction of a fuel and an oxidant to generate electricity. In a polymer electrolyte fuel cell (PEFC), hydrogen is oxidized in the anode (fuel electrode) to produce protons and electrons. The protons cannot pass through a non-aqueous proton exchange membrane, but instead travel through the membrane. The electrons cannot penetrate the membrane. Instead, the electrons travel through an external circuit and provide the energy necessary to drive a load, which may be a combination of electrical machines and systems. Typically, in proton exchange membrane fuel cells, hydrogen is provided to the fuel electrode as a vapor by having liquid hydrogen introduced into the fuel electrode. The external circuit consists of a pair of electrodes and an ionomer membrane disposed therebetween. The pair of electrodes may define a plurality of membrane electrode assemblies and may be separated by a plurality of separator plates. In a fuel cell used in some applications, the membrane electrode assembly has the hydrogen electrode on the fuel-supplying side and the oxygen electrode on the oxygen-supplying side. In the fuel cell, the oxygen electrode serves as the gas diffusion electrode where oxygen from the air and hydrogen from the fuel introduced from the respective sides of the membrane electrode assembly combine to produce electricity, heat and water as by-products. At the same time, the oxygen electrode also acts as an electrode through which oxygen ions reach the hydrogen electrode. With such a fuel cell, a plurality of fuel cells are typically arranged as described in Patent Literature 1. The fuel cells may be arranged in multiple stages in a fuel cell stack by arranging multiple membrane electrode assembly/electrode substrate/membrane electrode assembly combinations in series. With the conventional stack structure, however, there are cases in which it is difficult to arrange the membrane electrode assembly/electrode substrate/membrane electrode assembly in the order given and the membrane electrode assembly is put in between the separator plates in such a manner as to bypass intermediate electrode substrate portions, which may create spaces in the fuel cell stack. When locations of the electrodes
