More particularly, the present invention relates to the art of forming an envelope of translucent, transparent or colorless polymeric material for supporting the electrical and/or optical components of a lamp structure, and to the use of the same as a reflector sheet. Heretofore, planar envelopes have been used in a variety of lamps. For example, a lamp in which a phosphor is sealed in a transparent envelope is described in U.S. Pat. No. 2,933,603, to T. S. Williams, entitled "Electroluminescent Display." A lamp construction is described in U.S. Pat. No. 4,088,725, to R. A. Beckert, entitled "Lamp Construction." An example of a lamp construction is described in U.S. Pat. No. 4,291,476, to R. A. Beckert, entitled "Lamp Construction". In these and similar applications, light is produced in response to an electric charge which is deposited on a material of phosphor composition, the phosphor composition producing light in response to that electric charge. In these examples, a phosphor composition is deposited on the inside surface of a translucent envelope. Thus, the phosphor is an interior element of the lamp construction. The envelope contains an exterior element which is usually, but not necessarily, a reflector sheet. The phosphor is located between the reflector sheet and the inside of the envelope. In some other lamps, the phosphor composition

A: The problem may be with the fact that the web server is out of the scope of the kontronion.org domain. When loading a page that utilizes PHP, the script tries to modify the web server files. Try turning off the PHP extension or set a Document Root pointing to the same directory as kontronion.org, which is /var/www/. Lesion location and symptom onset in hemispheric, multiple sclerosis. To delineate subtypes of MS, the authors examined the relationship between lesion location and symptom onset in the hemispheres of 167 patients with definite MS. Patients were grouped into bilateral and unilateral hemispheric involvement. The data were analyzed by the logistic regression analysis of the multiple serial lesion-symptom mapping technique. The probability of simultaneous, left hemispheric onset of upper and lower extremity symptoms increased along the rostral-caudal axis from temporal to frontal (P -8 = -c*s. Suppose v = -2*r - 3*r. It is necessary to affix an object to be affixed such as a dry cell to a lead wire to make the dry cell and the lead wire inseparable from each other, to quickly discharge all the gas in the dry cell, and the like. An adhesive tape method wherein an object to be affixed is stuck to a tape carrying a soft resin and which is bonded to one side of a hard resin tape by pressurizing the object with the hard resin tape and removing the hard resin tape from the hard resin tape has been used as a simple method. However, this method has a problem that it is necessary to peel the hard resin tape away from the object to be affixed and to peel off the adhesive tape from the object to be affixed after the adhesive tape has been attached, and thus, the object to be affixed can be damaged. On the other hand, as an invention to solve the above problems, an adhesive tape method wherein a coating of a pressure-sensitive adhesive having a softening point of 40.degree. C. or less in a prescribed amount is formed on one side of a hard resin tape, and an object to be affixed is stuck to the hard resin tape by pressurizing the hard resin tape and the object to be affixed by pressurizing the coated side of the hard resin tape with the object to be affixed after the coated side of the hard resin tape has been fixed to one surface of the object to be affixed, is disclosed in Japanese Patent Application Laid-Open No. 135019/1982. According to the above invention, a simple method wherein the above object to be affixed is bonded to the adhesive tape by pressurizing the above object to be affixed and the hard resin tape and then the object to be affixed and the hard resin tape are separated from each other can be used. However, since the adhesive tape
