Synthesia 10.6 Crack With Unlocking Key Full Download 2020. Adsorption effects of metal ions on the structure of anisotropic zeolite films. In the authors' previous study, (Bergström et al., J. Phys. Chem. B, 2005, 109, 4556) it was reported that the adsorption of Mg²⁺ cations in 4-, 7-, and 11-membered rings strongly affected the structure of the corresponding films of aluminosilicates. This effect is a possible basis for an additional method of applying anisotropic zeolite films for catalysis. In the present article the adsorption effects of metallic Mg, Ca, and Zn cations on the structure of anisotropic films of a polymorph of zeolite, ZSM-5, are reported. The anisotropic films were deposited on the external surface of quartz substrates at the air/water interface using Langmuir-Blodgett deposition. The results obtained during the depositions show that the addition of metal ions in excess decreases the vertical mobility of the monolayer in relation to the crystals as determined by reflection-absorption infrared spectroscopy. The local ordering of the aluminosilicate crystals is modified by the metal ions in the films with respect to the structure of the crystals in the bulk of the substrate. In addition, the lattice parameters and the adsorption positions of the metal ions were determined in film with different metal to zeolite ratios in comparison with the bulk crystals and existing data in the literature.
