Where does AutoCAD fit into the CAD stack? AutoCAD is a commercial computer-aided design (CAD) and drafting software application. Developed and marketed by Autodesk, AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. The release of AutoCAD was quite a departure from the past. During the beginning of the 1980s, large-scale architectural and engineering firms were the primary users of CAD. Most of these CAD systems were for engineering and architecture and used D-I-Y type methods. One of the first pre-release AutoCAD systems included a program called ADA (for AutoCAD Architecture). The developer of AutoCAD was lead engineer John Warnock. However, AutoCAD was not the first design software program on the market – that distinction belongs to a product called THE (The New Engineers' Tool). Since then, there have been many other programs available, but none of these have become as well known as AutoCAD. The lack of competition means that most users are unaware of other programs on the market. This is due to the fact that for most, if not all, of the applications there is no need to move between different types of software. The benefits of using one application are usually self-evident. Extensibility Autodesk software that is normally part of AutoCAD also provides APIs which can be used to extend and modify its functionality, and programs can use these APIs to perform specific tasks which would otherwise require an AutoCAD expert. Autodesk Exchange Apps AutoCAD has always been a program that is easy to learn, but the learning curve can be steep if you are a first-time user. The ability to import and export data in the DXF format is a great help. If you are designing a building you can save the DXF file on a thumb drive and take it to the construction site. This gives you the benefit of being able to use other programs to design the building. You can design in AutoCAD on the laptop, send the DXF file to the work station where your company's AutoCAD expert will then load it into the AutoCAD program, and then export the drawing as a DXF file. With AutoCAD Exchange App, you can use the web to communicate with other Autodesk applications. The web applications can be run from a web browser, which means there is no installation or learning curve to using these web-based applications. You can use Web Space to design or create a drawing in a web-based application and then you can send the web-based drawing to your AutoCAD expert who will then load the drawing into the AutoCAD program. Once the drawing has been loaded, you can then export it as a DXF file. You can also send a DXF file to your AutoCAD expert and they will load the DXF file into the AutoCAD program, and then export it as a DXF file. With the technology in place, people can use their computers to design buildings and other structures. Some of these designs can be very complex. It would be very expensive to have an AutoCAD expert go to the building site to set up the buildings and designs. With the use of the technology and the web-based applications, it would be possible to use a web browser on a laptop to design the buildings and then send the drawings to the AutoCAD expert who will load the drawings and export them as DXF files. The DXF files can then be used by AutoCAD to create the building. In some cases, the use of the web-based applications can save companies money. References ca3bfb1094
