Introduction: Electrical stimulation of the nervous system can be used for the purpose of improving memory and motor function as well as for treatment of the dementias. In the first part of this presentation I will give an overview of the neurobiology of synaptic plasticity, the cellular and molecular mechanisms leading to the establishment of long-term potentiation, and the established role of memory and cognition in this process. The second part will describe several techniques used to study the role of long-term potentiation in memory and cognition. The methods used will be: (1) fMRI to image the activation of brain regions involved in learning; (2) transcranial magnetic stimulation to study the development of long-term potentiation in the motor cortex; (3) lesion studies to identify brain regions necessary for long-term potentiation, and (4) transgenic mice with targeted deletion of genes, which play a key role in long-term potentiation, to study the effects on learning and memory. Finally, some novel approaches such as transcranial optical stimulation, and electrical stimulation during sleep will be presented. While this presentation will not cover in detail, the cellular

and molecular mechanisms involved in LTP, I will attempt to present the importance of this phenomenon for the memory and cognition, and the importance of clinical approaches to improve learning and cognition. I hope that this presentation will help you to understand how our brain stores information./* Copyright (c) 2012 LinkedIn Corp.
