A perfect example is the AIA structural engineering standard, wherein extensive calculation of stresses, supports, and other structural details is required. However, the time required to create a model for this type of design using conventional CAD tools can be prohibitive. In AutoCAD, one can draw structural elements directly and create the associated stress and supporting detail. This allows the designer to focus on the functional design, rather than spending time creating a model that then must be manipulated to create a stress model. Laziness is a vice. Take a look at this. This is a sign on the back of a garbage can. There is a business behind it and the sign doesn't tell it. It could be advertising a "donation" for dogs. The one in the photo, it seems, is going to be altered to read, "All donations will be used to make American flags out of old underwear." What is the prize? Keep the turtle for a day, and then call the closest animal rehabilitator. He will be able to tell you if he can catch and release the turtle, or if you should let him go in the river. If he can't handle it, and you want to release the turtle yourself, you can do so with no problem. However, if you keep the turtle for a month, then you have to mail it to the nearest turtle court. If you win, you will be crowned king of the hamlet for a year. If you don't win, you'll have to drink a barrel of beer. This is the kind of problem you can solve with logic. 1) Which would be worse, to drink the whole barrel, or to drink a whole barrel of beer? The answer is that
