VollversionbfdcmQ: Proof of
quicksort for binary search trees
The question is as follows: How
to prove that quicksort $Q(A)$
for a binary search tree A

have the property: $Q(A) = \left(\bigcup_{i=1}^p [A_{1}^{(i)}, A_{2}^{(i)}] \right) \quad \square, \square$

(1) where $A = \bigcup_{i=1}^p A_{1}^{(i)}$, $A = \bigcup_{i=1}^p A_{2}^{(i)}$,
 and p is the number of iterations of partition. So, for a binary search tree, I'm not sure what a binary search tree would mean? A: I assume your binary search tree A is a node-labeled binary tree with A itself being a leaf. Then we can assume $A = \bigcup_{i=1}^p$
